

# STEP BY STEP INSTRUCTIONS TO BUILD YOUR OWN GREENHEAD TRAP

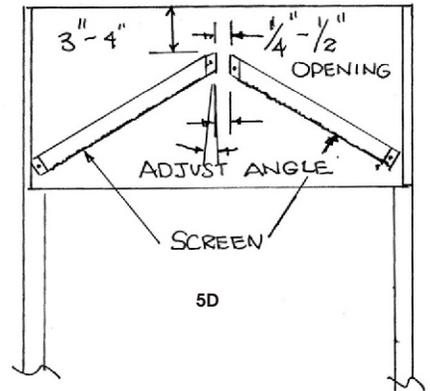

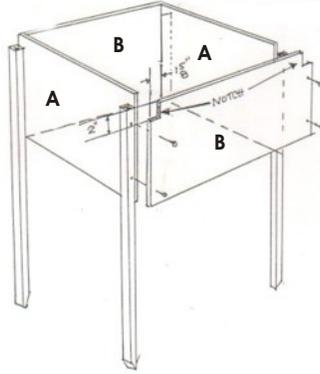

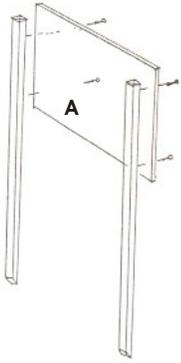

PLYWOOD CUTTING

1. Cut 4' x 8" plywood into (9) 16" x 32" pieces (most Lumber yards will cut to size for an extra charge).

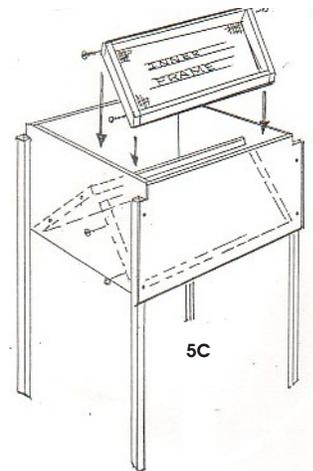

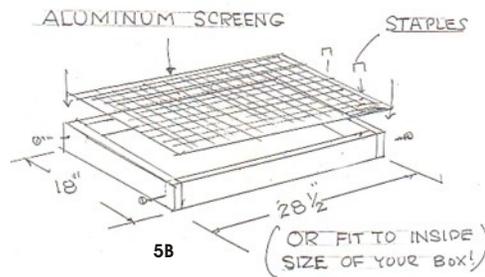

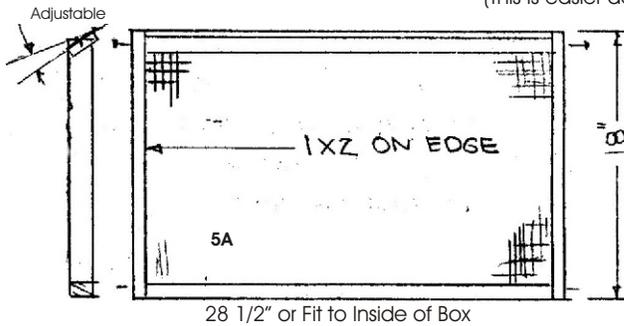

2. Notch upper corners of two sides to allow for removable top screened frame

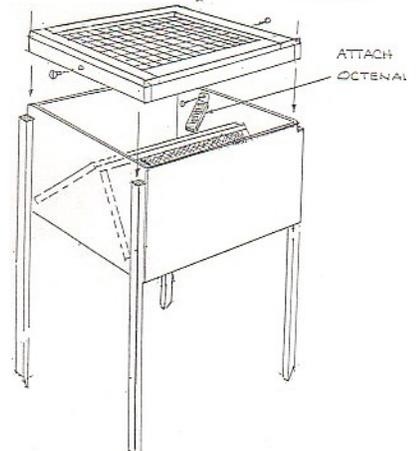

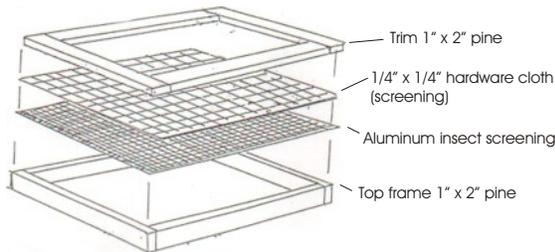

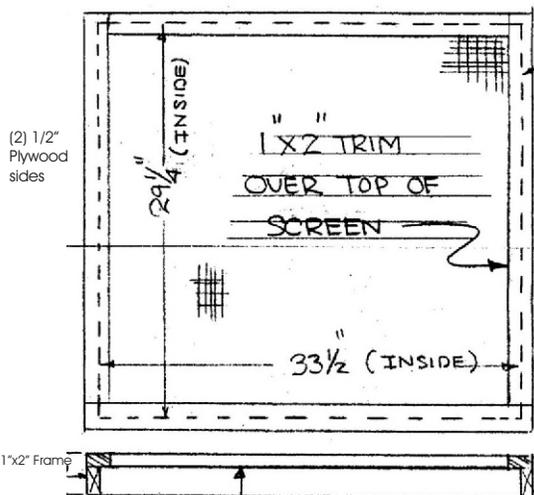

3. Attach legs to (2) 16" x 32" plywood sides

4. Attach two other sides with 1 5/8" deck screws. (This is easier done upside down).

5. Fabricate 2 inner screen frames from 1" x 2" pine, attach with (4) 15/8" deck screws through short 18" side. Attach screening but leave 2 screws loose to allow for adjustment of opening for flies. This should be adjusted after insertion into box body. Refer to drawing 5C & 5D.

NOTE: Fit Top Frame to Actual Size of box

6. Fabricate the removable top screened frame as shown. The 1/4" x 1/4" cloth makes for a more vandal proof unit and is optional. Attach to box with 2 screws. This cover is removed to empty dead flies, service unit and replace Octenal lures. **Attach Octenal lures to inside of box.**

7. Completed unit. Install in an open area away from patios and decks.

**Octenal lures (\$5 each plus S&H) can be purchased from Biosensory, Inc.**  
At <http://www.biosensory.com> or (860) 423-3009. They typically last 1-2 months.
